

Report Documentation Page				Form Approved OMB No. 0704-0188	
Public reporting burden for the collection of information is estimated to average 1 hour per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden, to Washington Headquarters Services, Directorate for Information Operations and Reports, 1215 Jefferson Davis Highway, Suite 1204, Arlington VA 22202-4302. Respondents should be aware that notwithstanding any other provision of law, no person shall be subject to a penalty for failing to comply with a collection of information if it does not display a currently valid OMB control number.

LONG-TERM GOALS

This ONR grant promotes the development and application of advanced machine learning techniques for detection and classification of marine mammal sounds.

OBJECTIVES

The objective is to engage a broad community of data scientists in the development and application of advanced machine learning techniques for detection and classification of marine mammal sounds.

APPROACH

This research project will utilize an existing website, Kaggle.com, to host a bioacoustic detection-classification data challenge. This data challenge will be open to all international parties, allowing for a large quantity of solutions to be tested on a bioacoustic dataset.

Cornell will provide with existing, validated datasets of marine mammal acoustic exemplars for the contest. This requires time to validate and build test sets and training sets, which will be hosted on kaggle.com and will be freely available to the public. Cornell will first validate existing datasets and create the necessary formats for kaggle.com. Kaggle will host the contest, providing access to automated scoring tools and online public leader board.

This approach will be similar to that used in the first open Kaggle competition held in association with the Workshop on Machine Learning for Bioacoustics at the International Conference in Machine Learning, Atlanta, Georgia in 2013 [1, 2, 3].

WORK COMPLETED

No work has yet been completed on this project. We are still in the process of assembling the test and training data sets.

RESULTS

There are no results yet for this project.

IMPACT/APPLICATIONS

The bioacoustics community collects very large amounts of marine acoustic data, which is challenging to analyze for the acoustic occurrence of marine mammals. Novel detection-classification technologies are needed to process these data. The marine mammal bioacoustics community would benefit from engaging and collaborating with the machine learning community.
